An interesting subgroup among the compounds of formula (I) comprises those compounds of formula (I) wherein  $-A^1 = A^2 = A^3 = A^4$  is a bivalent radical having the formula (a-1).

Another interesting subgroup among the compounds of formula (I) comprises those compounds of formula (I) wherein  $-A^1 = A^2 = A^3 = A^4$  is a bivalent radical having a formula (a-2) through (a-7), with (a-2) being the most interesting subgroup.

Among the above subgroups those compounds of formula (I) are preferred wherein Het is the particular Het described hereinabove.

Particularly preferred compounds within the invention are those preferred compounds within the invention wherein R<sup>1</sup> is hydrogen, C<sub>2</sub>-alkenyl, C<sub>3</sub>-alkynyl, Ar<sup>1</sup> or C<sub>1</sub>-alkyl optionally substituted with 10 carboxyl, G is O, L is hydrogen, C<sub>1</sub>-alkyl or a radical of formula (b-1), (b-2) or (b-3) and B is NH or CH<sub>2</sub>.

The compounds of formula (I) can generally be prepared by reacting an intermediate of formula (II) with a diamine of formula (III).

20

25

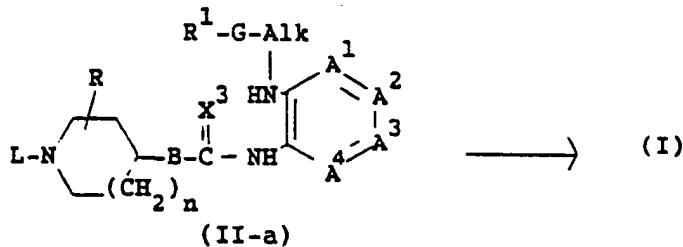

30

In some instances the reaction of (II) with (III) first yields an intermediate of formula (II-a)

35

40

45

which may in situ or, if desired, after isolating and purifying it, be cyclized to obtain the desired compounds of formula (I).

In the foregoing and following reaction schemes W and W' represent an appropriate leaving group such as, for example, halo, e.g., chloro, bromo or iodo, or a sulfonyloxy group, e.g., methylsulfonyloxy or 4-methylphenylsulfonyloxy, whereas W may also be alkoxy, alkylthio, Ar<sup>2</sup>-O- or Ar<sup>2</sup>-S-. X<sup>3</sup> in formulae (II) and (II-a) represents O, S or NH.

50

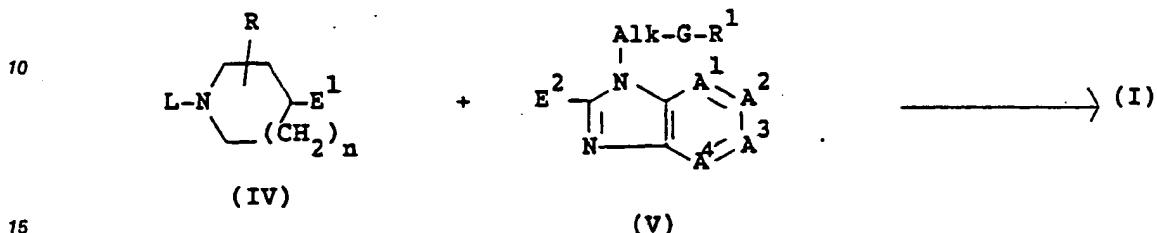

The piperidine, pyrrolidine or hexahydro-1H-azepine derivatives of formula (II) may in situ be generated, for example, by converting a piperidine, pyrrolidine or hexahydro-1H-azepine which is substituted with a -B-C(=X<sup>3</sup>)-OH radical into an intermediate of formula (II) by reacting the former with thionyl chloride, phosphor trichloride, phosphoryl chloride, polyphosphoric acid, phosphoroxy chloride and the like.

55

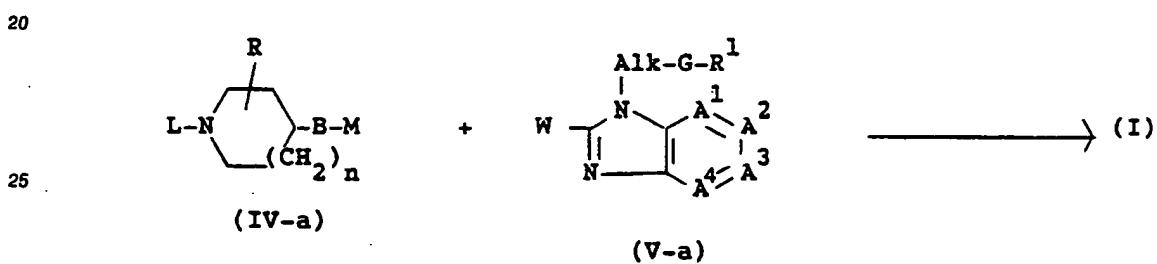

The reaction of (II) with (III) may be conducted in a suitable solvent such as, for example, a hydrocarbon, e.g., benzene, hexane; an ether, e.g., 1,1'-oxybisethane, tetrahydrofuran; a ketone, e.g., 2-propanone, 2-butanone; an alcohol, e.g., methanol, ethanol, 2-propanol, 1-butanol; a halogenated hydrocarbon, e.g., trichloromethane, dichloromethane, an organic acid, e.g., acetic acid, propanoic acid; a polar aprotic solvent, e.g., N,N-dimethylformamide, N,N-dimethylacetamide and the like; and mixtures of such

solvents. Depending upon the solvent and nature of W it may be appropriate to add a suitable base and/or a iodide salt, preferably an alkali metal iodide, to the reaction mixture. Elevated temperatures may enhance the reaction rate.

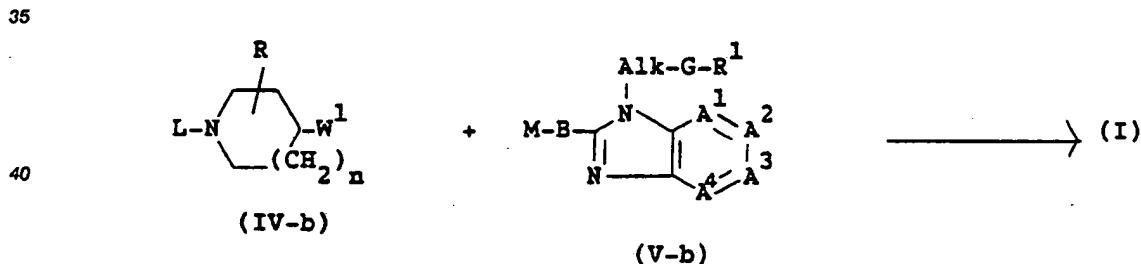

5 The compounds of formula (I) can also be prepared by reacting an intermediate of formula (V) with an intermediate of formula (IV) wherein E<sup>1</sup> and E<sup>2</sup> are selected so that during the reaction a bivalent radical -B- is formed.

For example, the compounds of formula (I) can be prepared by reacting an intermediate of formula (IV) wherein E<sup>1</sup> is a radical of formula -B-M with an intermediate of formula (V) wherein E<sup>2</sup> is a radical W.

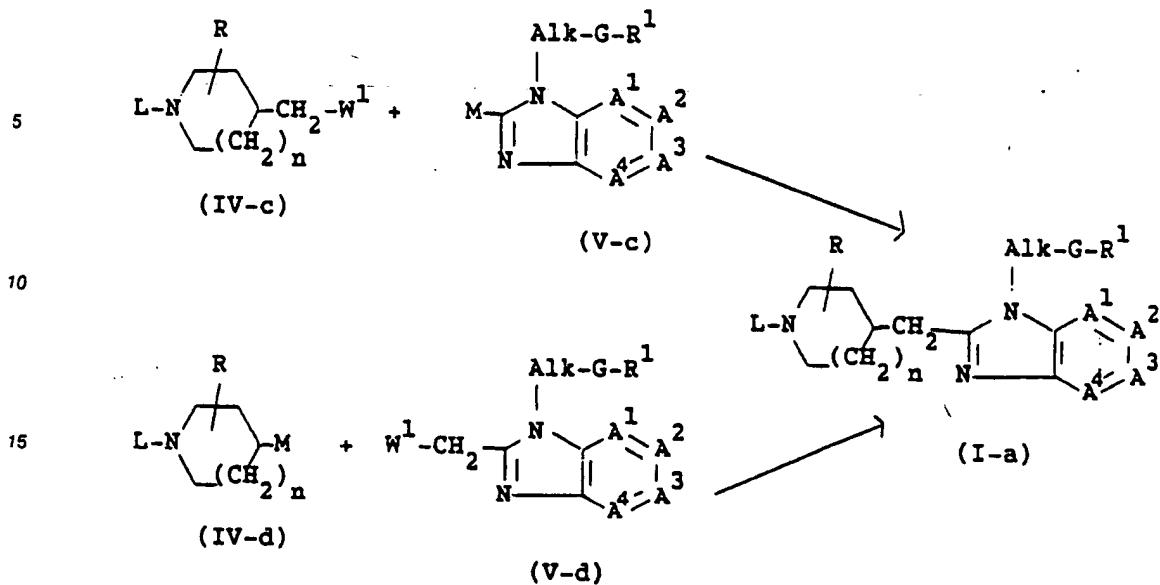

30 In (IV-a) M is, depending upon the nature of B, hydrogen or an appropriate alkali metal or earth alkaline metal and in (V-a) W has the previously described meanings. Additionally, the compounds of formula (I) can also be prepared by reacting an intermediate of formula (IV) wherein E<sup>1</sup> is W<sup>1</sup> with an intermediate of formula (V) wherein E<sup>2</sup> is a radical of formula -B-M, said W<sup>1</sup> and M having the previously described meanings.

45 More particularly, the compounds of formula (I) wherein B is -CH<sub>2</sub>- can also be prepared by reacting an intermediate of formula (IV) wherein E<sup>1</sup> represents a radical of formula -CH<sub>2</sub>-W<sup>1</sup>, (IV-c), with an intermediate of formula (V) wherein E<sup>2</sup> represents M, (V-c) or alternatively, by reacting an intermediate of formula (IV), wherein E<sup>1</sup> is a radical of formula -M, (IV-d), with an intermediate of formula (V) wherein E<sup>2</sup> is a radical of formula -CH<sub>2</sub>W<sup>1</sup>, (V-d).

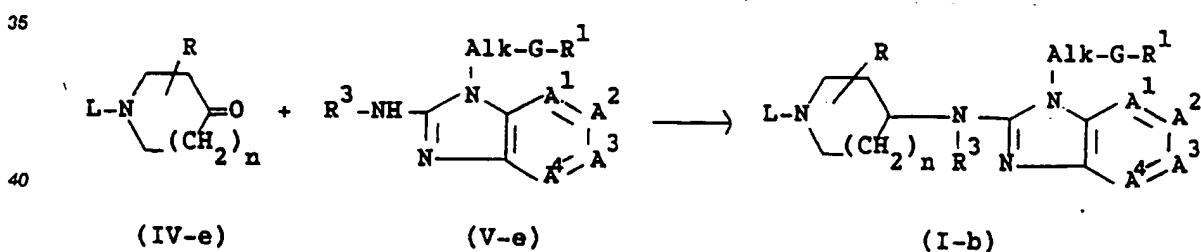

50

55

20 The reactions of (IV-a) with (V-a), (IV-b) with (V-b), (IV-c) with (V-c) and (IV-d) with (V-d) may conveniently be conducted in an appropriate solvent such as, for example, an aromatic hydrocarbon, e.g., benzene, methylbenzene; an ether, e.g., 1,4-dioxane, 1,1'-oxybisethane, tetrahydrofuran and the like; a halogenated hydrocarbon, e.g., trichloromethane and the like; N,N-dimethylformamide (DMF); N,N-dimethylacetamide (DMA); and where M is hydrogen, said solvent may also be a C<sub>1</sub>-alkanol, e.g., methanol, ethanol, 1-butanol and the like; a ketone, e.g., 2-propanone, 4-methyl-2-pentanone and the like. In some instances, the addition of an appropriate base such as, for example, an alkali metal carbonate or hydrogen carbonate, sodium hydride or an organic base such as, for example, N,N-diethylethanamine or N-(1-methylethyl)-2-propanamine and/or the addition of an iodide salt, preferably an alkali metal iodide, may be appropriate.  
25  
30 Somewhat elevated temperatures may enhance the rate of the reaction.

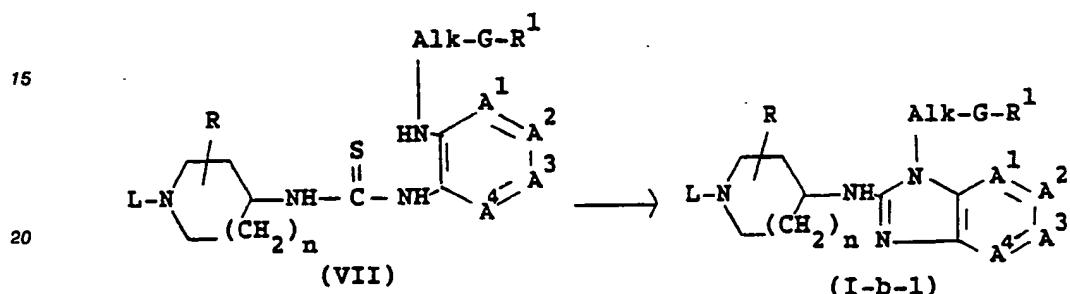

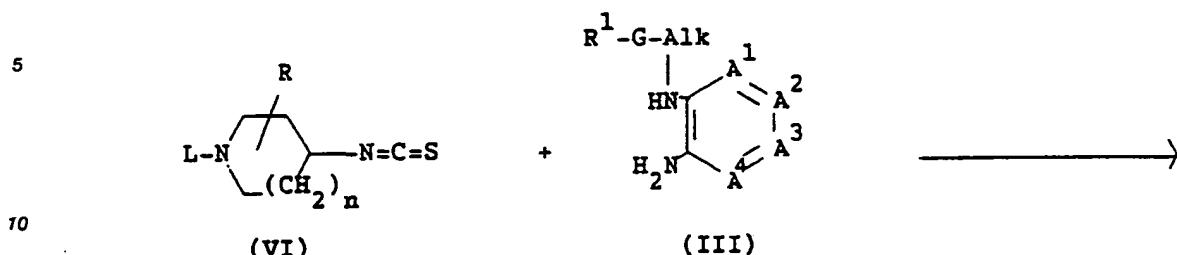

Or, the compounds of formula (I) wherein B is  $-\text{NR}^3-$  can also be prepared by reacting an intermediate of formula (IV) wherein  $\text{E}^1$  is an oxo radical, (IV-e), with an intermediate of formula (V) wherein  $\text{E}^2$  represents a radical  $-\text{NHR}^3$ , (V-e).

45 The reaction of (IV-e) with (V-e) is conveniently carried out by treating a mixture of the reactants in a suitable reaction-inert organic solvent with an appropriate reductant. Preferably, the 3-pyrrolidinone, 4-piperidinone or hexahydro-1H-azepine-4-one of formula (IV-e) is first reacted with the benzimidazolamine of formula (V-e) to form an enamine, which optionally may be isolated and further purified, and subsequently subjecting the said enamine to a reduction reaction. Suitable solvents are, for example, water; C<sub>1</sub>-alkanols, e.g., methanol, ethanol, 2-propanol and the like; cyclic ethers, e.g., 1,4-dioxane and the like; halogenated hydrocarbons, e.g., trichloromethane and the like; N,N-dimethylformamide; N,N-dimethylacetamide; dimethyl sulfoxide and the like; or a mixture of such solvents. Appropriate reductants are for example, metal or complex metal hydrides, e.g., sodium borohydride, lithium aluminiumhydride; or hydrogen, the latter being preferably used in the presence of a suitable catalyst such as, for example, palladium-on-charcoal, platinum-on-charcoal and the like. In order to prevent the undesired further hydrogenation of certain functional groups in the reactants and the reaction products it may be advantageous to add an appropriate catalyst-poison to the reaction mixture, e.g., thiophene and the like.

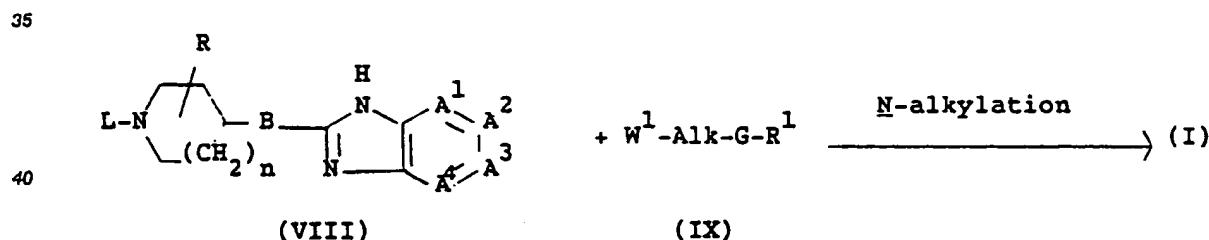

The compounds of formula (I) where B is  $-\text{NH}-$  can also be prepared by a cyclodesulfurization reaction of an appropriate thiourea derivative of formula (VII), which may in situ be formed by condensing an

isothiocyanate of formula (VI) with a diamine of formula (III).

Said cyclodesulfurization reaction may be carried out by the reaction of (VII) with an appropriate alkyl halide, preferably iodomethane in a suitable reaction-inert organic solvent, e.g., a lower alkanol such as, methanol, ethanol, 2-propanol and the like. Otherwise, the cyclodesulfurization reaction may be carried out by the reaction of (VII) with an appropriate metal oxide or salt in a suitable solvent according to art-known procedures. For example, the compounds of formula (I-b-1) can easily be prepared by the reaction of (VII) with a Hg(II) or Pb(II) oxide or salt such as, for example,  $HgO$ ,  $HgCl_2$ ,  $Hg(OAc)_2$ ,  $PbO$  or  $Pb(OAc)_2$ . In certain instances it may be appropriate to supplement the reaction mixture with a small amount of sulfur. Even so methanediimines, especially dicyclohexylcarbodiimide may be used as cyclodesulfurizing agents.

The compounds of formula (I) can also be prepared by N-alkylating an intermediate of formula (VIII) with an appropriate reagent of formula (IX).

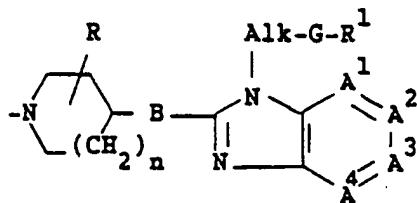

45 The N-alkylation reaction is conveniently conducted in an inert organic solvent such as, for example, an aromatic hydrocarbon, e.g., benzene, methylbenzene, dimethylbenzene, and the like; an alkanol, e.g., methanol, ethanol, 1-butanol and the like; a ketone, e.g., 2-propanone, 4-methyl-2-pentanone and the like; an ether, e.g., 1,4-dioxane, 1,1'-oxybisethane, tetrahydrofuran and the like; a polar aprotic solvent, e.g., N,N-dimethylformamide (DMF), N,N-dimethylacetamide (DMA), dimethyl sulfoxide (DMSO), nitrobenzene, 1-methyl-2-pyrrolidinone, and the like. In some instances the addition of a iodide salt, preferably an alkali metal iodide, is appropriate. Somewhat elevated temperatures may enhance the rate of the reaction.

The compounds of formula (I) can also be converted into each other. Some examples of such conversions will be described hereinafter.

In order to simplify the structural representations of the compounds of formula (I) and of certain precursors and intermediates thereof the

-radical will hereafter be represented by the symbol D.

The compounds of formula (I) wherein L is other than hydrogen, said L being represented by L<sup>1</sup>, and

15 said compounds being represented by formula (I-c) can generally be prepared by N-alkylating a compound of formula (I) wherein L is hydrogen, said compounds being represented by formula (I-d), with a reagent of formula (X).

20

Said reductive N-alkylation reaction may conveniently be carried out by catalytically hydrogenating a stirred and heated mixture of the reactants in a suitable reaction inert organic solvent according to art-known catalytic hydrogenating procedures. The term "art-known catalytic hydrogenating procedures" means that the reaction is carried out under hydrogen atmosphere in the presence of an appropriate catalyst such as, for example, palladium-on-charcoal, platinum-on-charcoal and the like. In order to prevent the undesired further hydrogenation of certain functional groups in the reactants and the reaction products it may be advantageous to add an appropriate catalyst-poison to the reaction mixture, e.g., thiophene and the like.

Some intermediates and starting materials in the foregoing preparations are known compounds which may be prepared according to art-known methodologies of preparing said or similar compounds and others 55 are new. A number of such preparation methods will be described hereinafter in more detail.

The intermediates of formula (II), wherein B is CH<sub>2</sub>, X<sup>3</sup> is NH and W is C<sub>1</sub>-alkyloxy, said intermediates being represented by the formula (II-b), can be prepared by reacting a (cyanomethyl)derivative of formula (XIX) with an alcohol, e.g., methanol, ethanol and the like, in the presence of an acid, e.g., hydrochloric acid.

20

Nos. 4,219,559; 4,335,127; 4,342,870; 4,443,451; 4,634,704; 4,695,569 and 4,588,722, which are incorporated herein as reference.

25

From formula (I) it is evident that the compounds of this invention may have several asymmetric carbon atoms in their structure. Each of these chiral centers may be present in a R-and a S-configuration, this R- and S-notation being in correspondence with the rules described by R.S. Cahn, C. Ingold and V. Prelog in Angew. Chem., Int. Ed. Engl., 5, 385, 511 (1966).

30

Pure stereochemically isomeric forms of the compounds of formula (I) may be obtained by the application of art-known procedures.

35

~~Diastereoisomers may be separated by physical separation methods such as selective crystallization and chromatographic techniques, e.g., counter current distribution, and enantiomers may be separated from each other by the selective crystallization of their diastereomeric salts with optically active acids.~~

Pure stereochemically isomeric forms may also be derived from the corresponding pure stereochemically isomeric forms of the appropriate starting materials, provided that the reaction occurs stereospecifically.

40

It is evident that the cis and trans diastereomeric racemates may be further resolved into their optical isomers, (cis(+)), (cis(-)), (trans(+)) and (trans(-)) by the application of methodologies known to those skilled in the art.

45

Stereochemically isomeric forms of the compounds of formula (I) are naturally intended to be embraced within the scope of the invention.

The compounds of formula (I), the pharmaceutically acceptable acid-addition salts and possible stereochemically isomeric forms thereof possess useful pharmacological properties. More particularly, they are active as anti-histaminics which activity can clearly be demonstrated by, e.g., the results obtained in the "Protection of Rats from Compound 48/80-induced lethality"-test, the "Histamine antagonism in Guinea Pig"-test and the "Ascaris Allergy test in Dogs"-test described in Arch. Int. Pharmacodyn. Ther. 251, 39-51 (1981). Apart from their anti-histaminic properties some of the subject compounds also show serotonin-antagonism. Whereas some are active in the "Stress Ulcer Antagonism in Rats"-test which is related to the test described in European Journal of Pharmacology, 137 (1987) 127-129.

50

Furthermore the compounds of formula (I), the pharmaceutically acceptable acid-addition salts and stereochemically isomeric forms thereof are particularly attractive due to their favourable pharmacokinetical profile. In particularly, some show a rapid onset so that their anti-histaminic effects are almost instantaneously present.

55

In view of their anti-histaminic properties, the compounds of formula (I) and their acid-addition salts are very useful in the treatment of allergic diseases such as, for example, allergic rhinitis, allergic conjunctivitis, chronic urticaria, allergic asthma and the like.

In view of their useful pharmacological properties the subject compounds may be formulated into various pharmaceutical forms for administration purposes particularly in aqueous compositions as the compounds of formula (I) show an increased water solubility. To prepare the pharmaceutical compositions

of this invention, an effective amount of the particular compound, in base or acid addition salt form, as the active ingredient is combined in intimate admixture with a pharmaceutically acceptable carrier, which carrier may take a wide variety of forms depending on the form of preparation desired for administration. These pharmaceutical compositions are desirably in unitary dosage form suitable, preferably, for administration 5 orally, rectally, percutaneously, or by parenteral injection. For example, in preparing the compositions in oral dosage form, any of the usual pharmaceutical media may be employed, such as, for example, water, glycols, oils, alcohols and the like in the case of oral liquid preparations such as suspensions, syrups, elixirs and solutions; or solid carriers such as starches, sugars, kaolin, lubricants, binders, disintegrating agents and the like in the case of powders, pills, capsules and tablets. Because of their ease in administration, 10 tablets and capsules represent the most advantageous oral dosage unit form, in which case solid pharmaceutical carriers are obviously employed. For parenteral compositions, the carrier will usually comprise sterile water, at least in large part, though other ingredients, for example, to aid solubility, may be included. Injectable solutions, for example, may be prepared in which the carrier comprises saline solution, glucose solution or a mixture of saline and glucose solution. Injectable suspensions may also be prepared 15 in which case appropriate liquid carriers, suspending agents and the like may be employed. In the compositions suitable for percutaneous administration, the carrier optionally comprises a penetration enhancing agent and/or a suitable wetting agent, optionally combined with suitable additives of any nature in minor proportion, which additives do not introduce a significant deleterious effect on the skin. Said additives may facilitate the administration to the skin and/or may be helpful for preparing the desired 20 compositions. These compositions may be administered in various ways, e.g., as a transdermal patch, as a spot-on, as an ointment. Acid addition salts of (I) due to their increased water solubility over the corresponding base form, are obviously more suitable in the preparation of aqueous compositions.

It is especially advantageous to formulate the aforementioned pharmaceutical compositions in dosage 25 unit form for ease of administration and uniformity of dosage. Dosage unit form as used in the specification and claims herein refers to physically discrete units suitable as unitary dosages, each unit containing a predetermined quantity of active ingredient calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. Examples of such dosage unit forms are tablets (including scored or coated tablets), capsules, pills, powder packets, wafers, injectable solutions or suspensions, teaspoonfuls, tablespoonfuls and the like, and segregated multiples thereof.

30 The present invention is also related with a method of treating allergic diseases in warm-blooded animals suffering from said allergic diseases by administering an effective anti-allergic amount of a compound of formula (I) or a pharmaceutically acceptable acid addition salt thereof.

Those of skill in treating allergic diseases in warm-blooded animals could easily determine the effective 35 amount from the test results presented hereinafter. In general it is contemplated that an effective amount would be from 0.001 mg/kg to 100 mg/kg body weight, and more preferably from 0.01 mg/kg to 1 mg/kg body weight.

The following examples are intended to illustrate and not to limit the scope of the present invention in all its aspects. Unless otherwise stated all parts therein are by weight.

#### C. Pharmacological Examples

35 The useful antihistaminic properties of the compounds of formula (I) are demonstrated in the following test procedure.

#### Example 54

##### 40 Protection of rats from compound 48/80-induced lethality

Compound 48/80, a mixture of oligomers obtained by condensation of 4-methoxy-N-methylbenzeneethanamine and formaldehyde has been described as a potent histamine releasing agent (Int. Arch. Allergy, 13, 336 (1958)). The protection from compound 48/80-induced lethal circulatory collapse appears to 45 be a simple way of evaluating quantitatively the antihistaminic activity of test compounds. Male rats of an inbred Wistar strain, weighing 240-260 g were used in the experiment. After overnight starvation the rats were transferred to conditioned laboratories (temp. = 21 ± 1°C, relative humidity = 65 ± 5%). The rats were treated subcutaneously or orally with a test compound or with the solvent (NaCl solution, 0.9%). One hour after treatment there was injected intravenously compound 48/80, freshly dissolved in water, at a dose 50 of 0.5 mg/kg (0.2 ml/100 g of body weight). In control experiments, wherein 250 solvent-treated animals were injected with the standard dose of compound 48/80, not more than 2.8% of the animals survived after 4 hours. Survival after 4 hours is therefore considered to be a safe criterion of a protective effect of drug administration. The ED<sub>50</sub>-values of the compounds of formula (I) are listed in Table 1. Said ED<sub>50</sub>-values are 55 the values in mg/kg body weight at which the tested compounds protect 50% of the tested animals against compound 48/80-induced lethality.

10 20 Grams of the A.I., 6 grams sodium lauryl sulfate, 56 grams starch, 56 grams lactose, 0.8 grams colloidal silicon dioxide, and 1.2 grams magnesium stearate were vigorously stirred together. The resulting mixture was subsequently filled into 1000 suitable hardened gelating capsules, comprising each 20 milligrams of the active ingredient.

Example 58 : FILM-COATED TABLETS

Preparation of tablet core

20 A mixture of 100 grams of the A.I., 570 grams lactose and 200 grams starch was mixed well and thereafter humidified with a solution of 5 grams sodium dodecyl sulfate and 10 grams polyvinylpyrrolidone (Kollidon-K 90®) in about 200 milliliters of water. The wet powder mixture was sieved, dried and sieved again. Then there was added 100 grams microcrystalline cellulose (Avicel®) and 15 grams hydrogenated vegetable oil (Sterotex ®). The whole was mixed well and compressed into tablets, giving 10.000 tablets, 25 each containing 10 milligrams of the active ingredient.

Coating

30 To a solution of 10 grams methyl cellulose (Methocel 60 HG®) in 75 milliliters of denatured ethanol there was added a solution of 5 grams of ethyl cellulose (Ethocel 22 cps ®) in 150 milliliters of dichloromethane. Then there were added 75 milliliters of dichloromethane and 2.5 milliliters 1,2,3-propanetriol. 10 Grams of polyethylene glycol was molten and dissolved in 75 milliliters of dichloromethane. The latter solution was added to the former and then there were added 2.5 grams of magnesium 35 octadecanoate, 5 grams of polyvinylpyrrolidone and 30 milliliters of concentrated colour suspension (Opaspray K-1-2109®) and the whole was homogenated. The tablet cores were coated with the thus obtained mixture in a coating apparatus.

40 Example 59 : INJECTABLE SOLUTION

1.8 Grams methyl 4-hydroxybenzoate and 0.2 grams propyl 4-hydroxybenzoate were dissolved in about 0.5 liters of boiling water for injection. After cooling to about 50°C there were added while stirring 4 grams lactic acid, 0.05 grams propylene glycol and 4 grams of the A.I.. The solution was cooled to room 45 temperature and supplemented with water for injection q.s. ad 1 liter volume, giving a solution of 4 milligrams A.I. per milliliters. The solution was sterilized by filtration (U.S.P. XVII p. 811) and filled in sterile containers.

50 Example 60 : SUPPOSITORIES

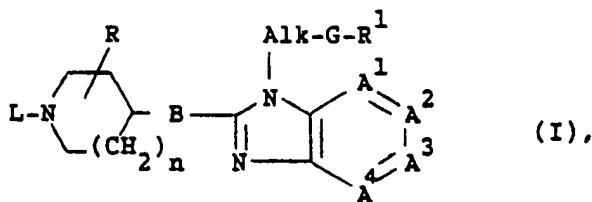

3 Grams A.I. was dissolved in a solution of 3 grams 2,3-dihydroxybutanedioic acid in 25 milliliters polyethylene glycol 400. 12 Grams surfactant (SPAN®) and triglycerides (Witepsol 555 ®) q.s. ad 300 grams were molten together. The latter mixture was mixed well with the former solution. The thus obtained mixture was poured into moulds at a temperature of 37-38°C to form 100 suppositories each containing 30 milligrams of the active ingredient.
